Overview

A SailPoint IdentityIQ plugin which validates the items (i.e., Role or Entitlement) which is(are) added in the cart for addition or removal from the identity(ies) before the submission. The functionality can be extended to any Entitlement or Roles validations as per business needs for each item(s).

Some use cases:

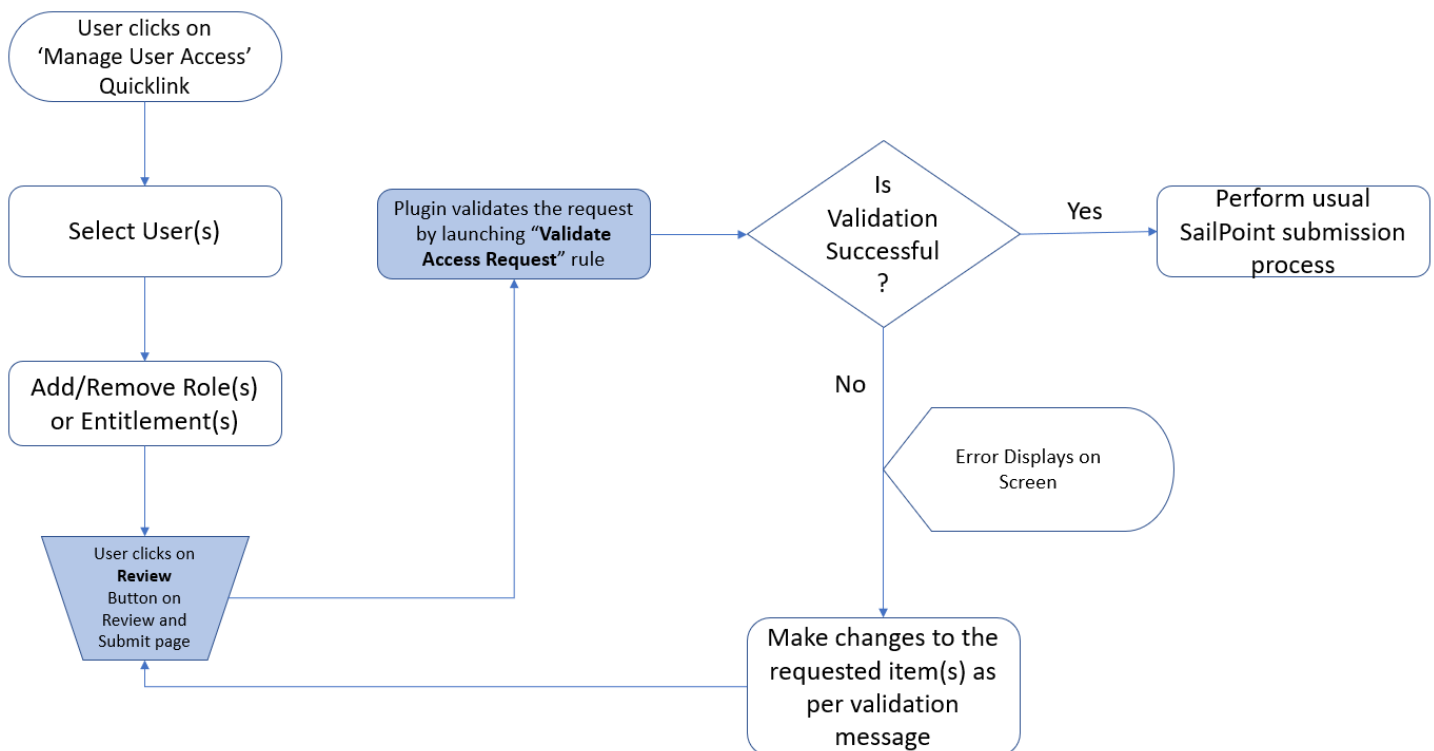

1. Business wants to do any validation checks on the access request raised without launching the workflow.
2. Comments validation on each request.
3. Policy violation check without launching the workflow which can eliminate unnecessary work items.
4. User is authorized to raise a particular request.
5. A particular user account is authorized to get an access.
so on...

Working

User clicks on “Manage User Access” Quicklink and select the user(s) for the which entitlement/role needs to be assigned and clicks on ‘Next’. Once the user is navigated to next screen, he/she is asked to add/remove item(s) in the cart, and then user clicks on ‘Next’ to submit the request. Once the user clicks on Review button, plugin will validate all the items requested for addition or removal item.

The Plugin will trigger a SailPoint IdentityIQ Rule (**Validate Access Request**) to perform the custom validation. If any validation error occurs, it will be sent back to UI with the error message displayed the screen. The Submit button will not appear until the validation error(s) are cleared. With each change in the requested item(s), Review button will be enabled, and validation will take place. Once the validation error(s) are cleared, submit button will be available to the user and it follow usual SailPoint submission behavior.

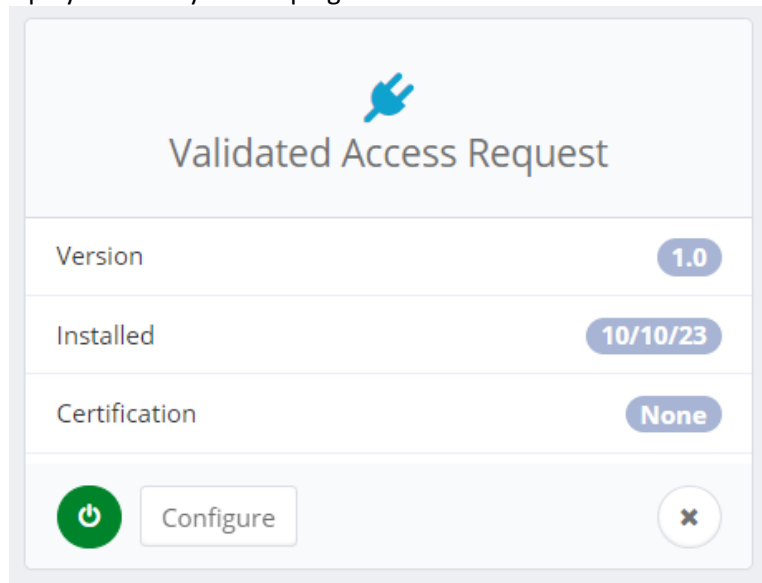

Make necessary changes to Validate Access Request Rule from Debug pages as per business requirement.

Installation Steps

As an Administrator, navigate to Gear> Plugins menu and click +New button. Select or drop ValidateAccessRequest.zip file (installer) into the Drag and Drop area.

A message will be displayed momentarily to confirm plugin was installed successfully, then Plugins page will be automatically refreshed to display the newly added plugin.

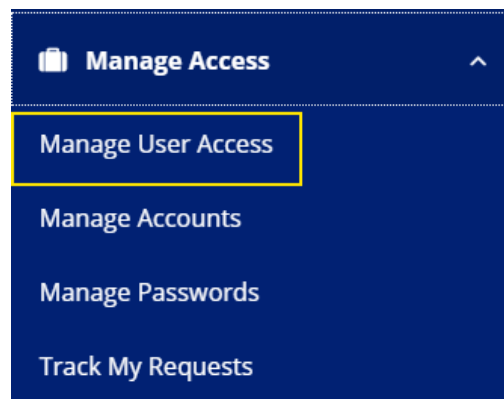

Validation Rule: Validate Access Request

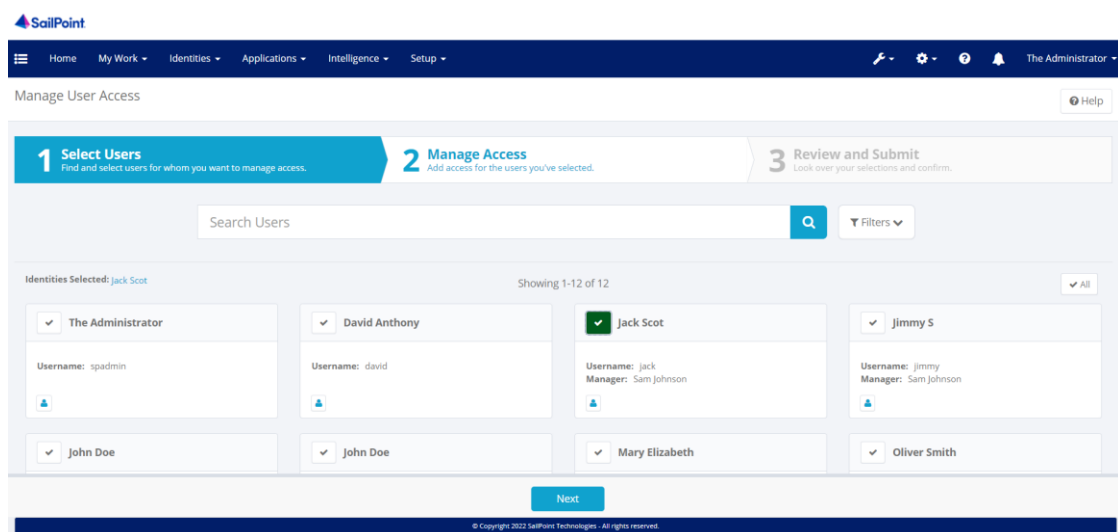

Make necessary changes to Validate Access Request Rule from Debug pages as per business requirement.

Uninstall

As an Administrator, navigate to Gear> Plugins menu and click 'X' icon on the Validate Access Request Plugin. Click on 'Yes' once prompted.

Debugging:

To enable loggers, add below in log4j2.properties file.

```
logger.validateAccessRequest.name=com.plugin.validateAccessRequest  
logger.validateAccessRequest.level=trace
```

Important Notes:

1. Implementors must make changes to Validate Access Request rule from debug as per the business requirement.
